### Addition Of Algebraic Expression

In mathematics, an algebraic expression is an expression built up from integer constants, variables, and the algebraic operations (addition, subtraction, multiplication, division and exponentiation by an exponent that is a rational number). For example,  $3x^2 - 2xy + c$  is an algebraic expression. Since taking the square root is the same as raising to the power  $1/2$ ,

Before we see how to add and subtract integers, we define terms and factors.. Terms and Factors. A term in an algebraic expression is an expression involving letters and/or numbers (called factors), multiplied together.. Example 1. The algebraic expression  $.5x$ . is an example of one single term.It has factors 5 and  $x$ .. The 5 is called the coefficient of the term and the  $x$  is a variable.
